1 Introduction

BS8414-2:2005 describes a method of assessing the behaviour of non-load bearing external cladding systems, rainscreen overcladding systems and external wall insulation systems when applied to a structural steel frame and exposed to an external fire under controlled conditions. The fire exposure is representative of an external fire source or a fully developed (post-flashover) fire in a room, venting through an opening such as a window aperture that exposes the cladding to the effects of external flames.

The specification and interpretation of fire test methods is the subject of on-going development and refinement. Changes in associated legislation may also occur. For these reasons it is recommended that the relevance of test reports over 5 years old should be considered by the user. The laboratory that issued the report will be able to offer, on behalf of the legal owner, a review of the procedures adopted for a particular test to ensure that they are consistent with current practices, and if required may endorse the test report.

All measurements given in this report are nominal unless stated otherwise.
2 Details of tests carried out

Name of Laboratory: BRE Global Ltd.
Laboratory Address: Bucknalls Lane, Garston, Watford, Hertfordshire. WD25 9XX
Telephone No.: [Redacted]
Fax No.: 295369
Test reference: 295369
Date of test: 2nd May 2014
Sponsor: Celotex Ltd
Sponsor address: Lady Lane Industrial Estate
Hadleigh
Suffolk
IP7 6BA

Sponsors Reference No:
Method: The test was carried out in accordance with BS8414-2:2005
Deviations: None
3 Description of the System

3.1 Description of substrate
The test specimen was installed onto face 1 of the BRE Global External Gladding Test Facility. This is a multi-faced test facility constructed from steel, the cladding system was affixed to the steel substructure.

3.2 Description of product

Figure 2 shows the system during construction. The system prior to test is shown in Figure 3. Full details of the system specification and installation details have been provided by the client and are summarised in the following section. The system, as built comprised of:

- Two layers of 10mm wall board.
- Simco EFS 100mm Light steel frame system (LSF).
- 12mm magnesium oxide sheathing board.
- Aluminium Helping hand brackets,
- Aluminium L and T rails,
- Lamatherm CW-RHS Horizontal Intumescent expanding fire break,
- Lamatherm CW-RSV Vertical non expanding fire breaks,
- 100mm Celotex RS5000 insulation board.
- 12mm Marley Eternit Natura decorative rain screen board

3.3 Installation of cladding System.

3.3.1 Steel substructure and fixings
A sectional steel Light frame system (LFS) was installed between the floor slab hangers on the main cladding wall, with horizontal base and head tracks fixed to the steel and concrete substrate. Vertical rails were installed at nominal 600mm centres to from the steel fame. A double layer of 10mm wall board was installed on the rear of the LFS and a single layer of 12mm magnesium oxide sheathing board was fixed to the front of the LFS. The build-up of the cladding system is shown in Figure 1 to Figure 8.

3.3.2 Cladding system
An array of aluminium helping hand brackets were mechanically fixed to the sheathing board using 50mm self-tapping screws. A single layer of 100mm Celotex RS5000 insulation board was mechanically attached to the sheathing board with 100mm self-tapping screws and metal washers. The insulation board was pushed over the helping hand brackets through pre-cut slots in the insulation boards.

3.3.3 Fire breaks
Four horizontal ventilated fire breaks (Lamatherm CW_RHS Ventilated cavity barrier) were fixed in a continuous strip and fixed back to the sheathing board with the manufactures recommended fixings. Four vertical non ventilated barriers (Lamatherm CW_RHS Non ventilated cavity barrier) were installed at the outer edges of the cladding system and vertically around the hearth opening to the full height of the test frame. The layout of the fire breaks is shown in Figure 7.
3.3.4 Rain screen

An array of vertical carrier rails were fixed to the helping hand brackets with both L and T aluminium brackets used. A single layer of 12 mm Marley Eternit Natura board was mechanically attached to the carrier rails with self-tapping stainless steel screws and washers.

3.4 Installation of Specimen

All test materials were supplied and installed by the sponsor. BRE were not involved in the sample selection process and therefore cannot comment upon the relationship between samples supplied for test and the product supplied to market.

3.5 Conditioning of the Specimen

Once the system was completed there was no requirement for conditioning before testing was undertaken.

3.6 Test Conditions

**Test Date:** 2nd May 2014

**Ambient Temperature:** 11.6°C

**Wind speed:** < 0.1 m/s, test undertaken indoors

**Frequency of measurement:** Data records were taken at five second intervals.

 Thermocouple locations:

- Level 1 – External
- Level 2 – External
- Level 2 – Mid point of cavity 1
- Level 2 – Mid point of insulation
- Level 2 – Mid point of magnesium oxide board
- Level 2 – Mid point of cavity 2

Figure 9 shows the locations and identification numbers of the thermocouples for the test specimen and also the face references used to describe the system.
4 Test results

4.1 Temperature Profiles

Figure 10 to Figure 15 provide the temperature profiles recorded during the test shows the sample during test.

</table>

5 Post-test damage report

5.1 External Layer
A schematic illustration of the damage to the system is shown in the condition of the cladding system after the test is shown in Figure 18. It was noted that the insulation layer continued to burn past the 30 minute with the flaming extinguished at 60 minutes.

5.2 Insulation Layer
The condition of the panels after the test is shown in Figure 19.

5.3 Collapse
There was minimal collapse of rain screen panel from 19 minutes from ignition and throughout the remainder of the test period.
