Subject: Fire Summit presentation

Boss,

I have asked Richard Mills to look over a previous presentation on high rise in preparation for the Fire Summit on 17 October and an early draft is attached for your review. They have asked for a presentation of about 30 mins on LFBs view (and role) in fire strategies in tall buildings, including the planning, engineering, enforcement and the fire-fighting strategies should the systems fail and a fire develop in these structures. Richard's team have adjusted the last slide as we have implemented the F.I.R.E bag but the rest remains unchanged. Nick Coombe is looking at the fire engineering aspects, ensuring that this links across to what they will be presenting on the second day.

In addition to this, and not mentioned in this presentation currently, do you think it should also include growing concerns over the cladding of buildings? This [article](#) is quite interesting and details external spread through cladding and insulation products.

Kind regards
Keeley
