Morning Harvey

As requested I had another look at the landings to avoid running any pipework within the heating pipe boxing.

I've measured up floor to ceiling heights.

- floor to original ceiling; 2335mm.
- floor to plasterboard; 2106mm.
- depth plasterboard box; 229mm.
- depth door frame above front door; 100mm.

Due to a decent depth of approx 100mm for the frame above the front door, It should be possible run a lateral around tight in the corner of each landing to all properties, avoiding running across the plasterboard and over the mechanical air vents.

GAS METER RESITES

All flats have an area of between 1m & 4m that back onto the communal landings which can be drilled through for new gas meter positions.

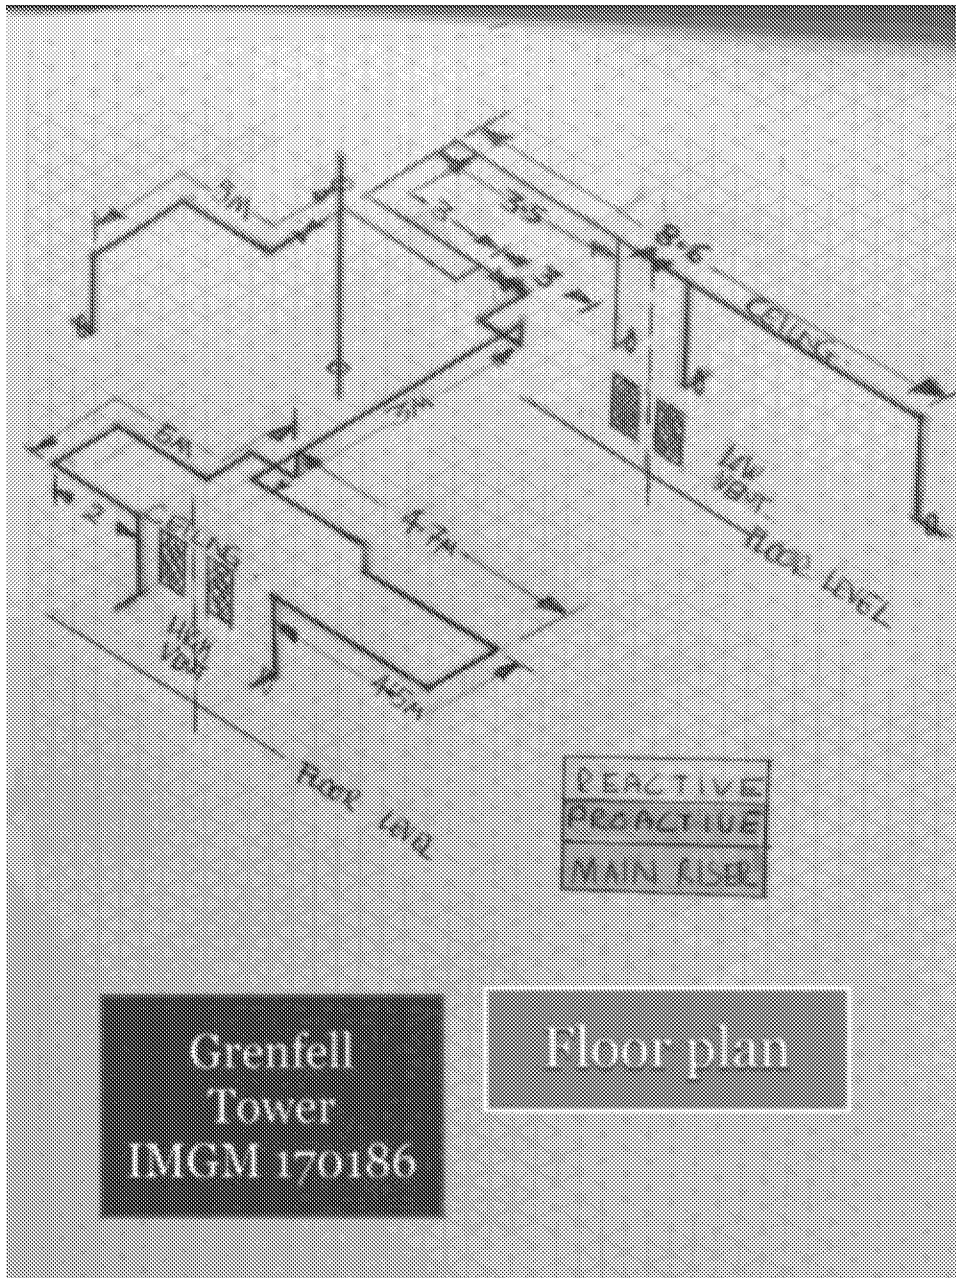

There are a variety of cupboards to relocate the meter into.

OUTLETS

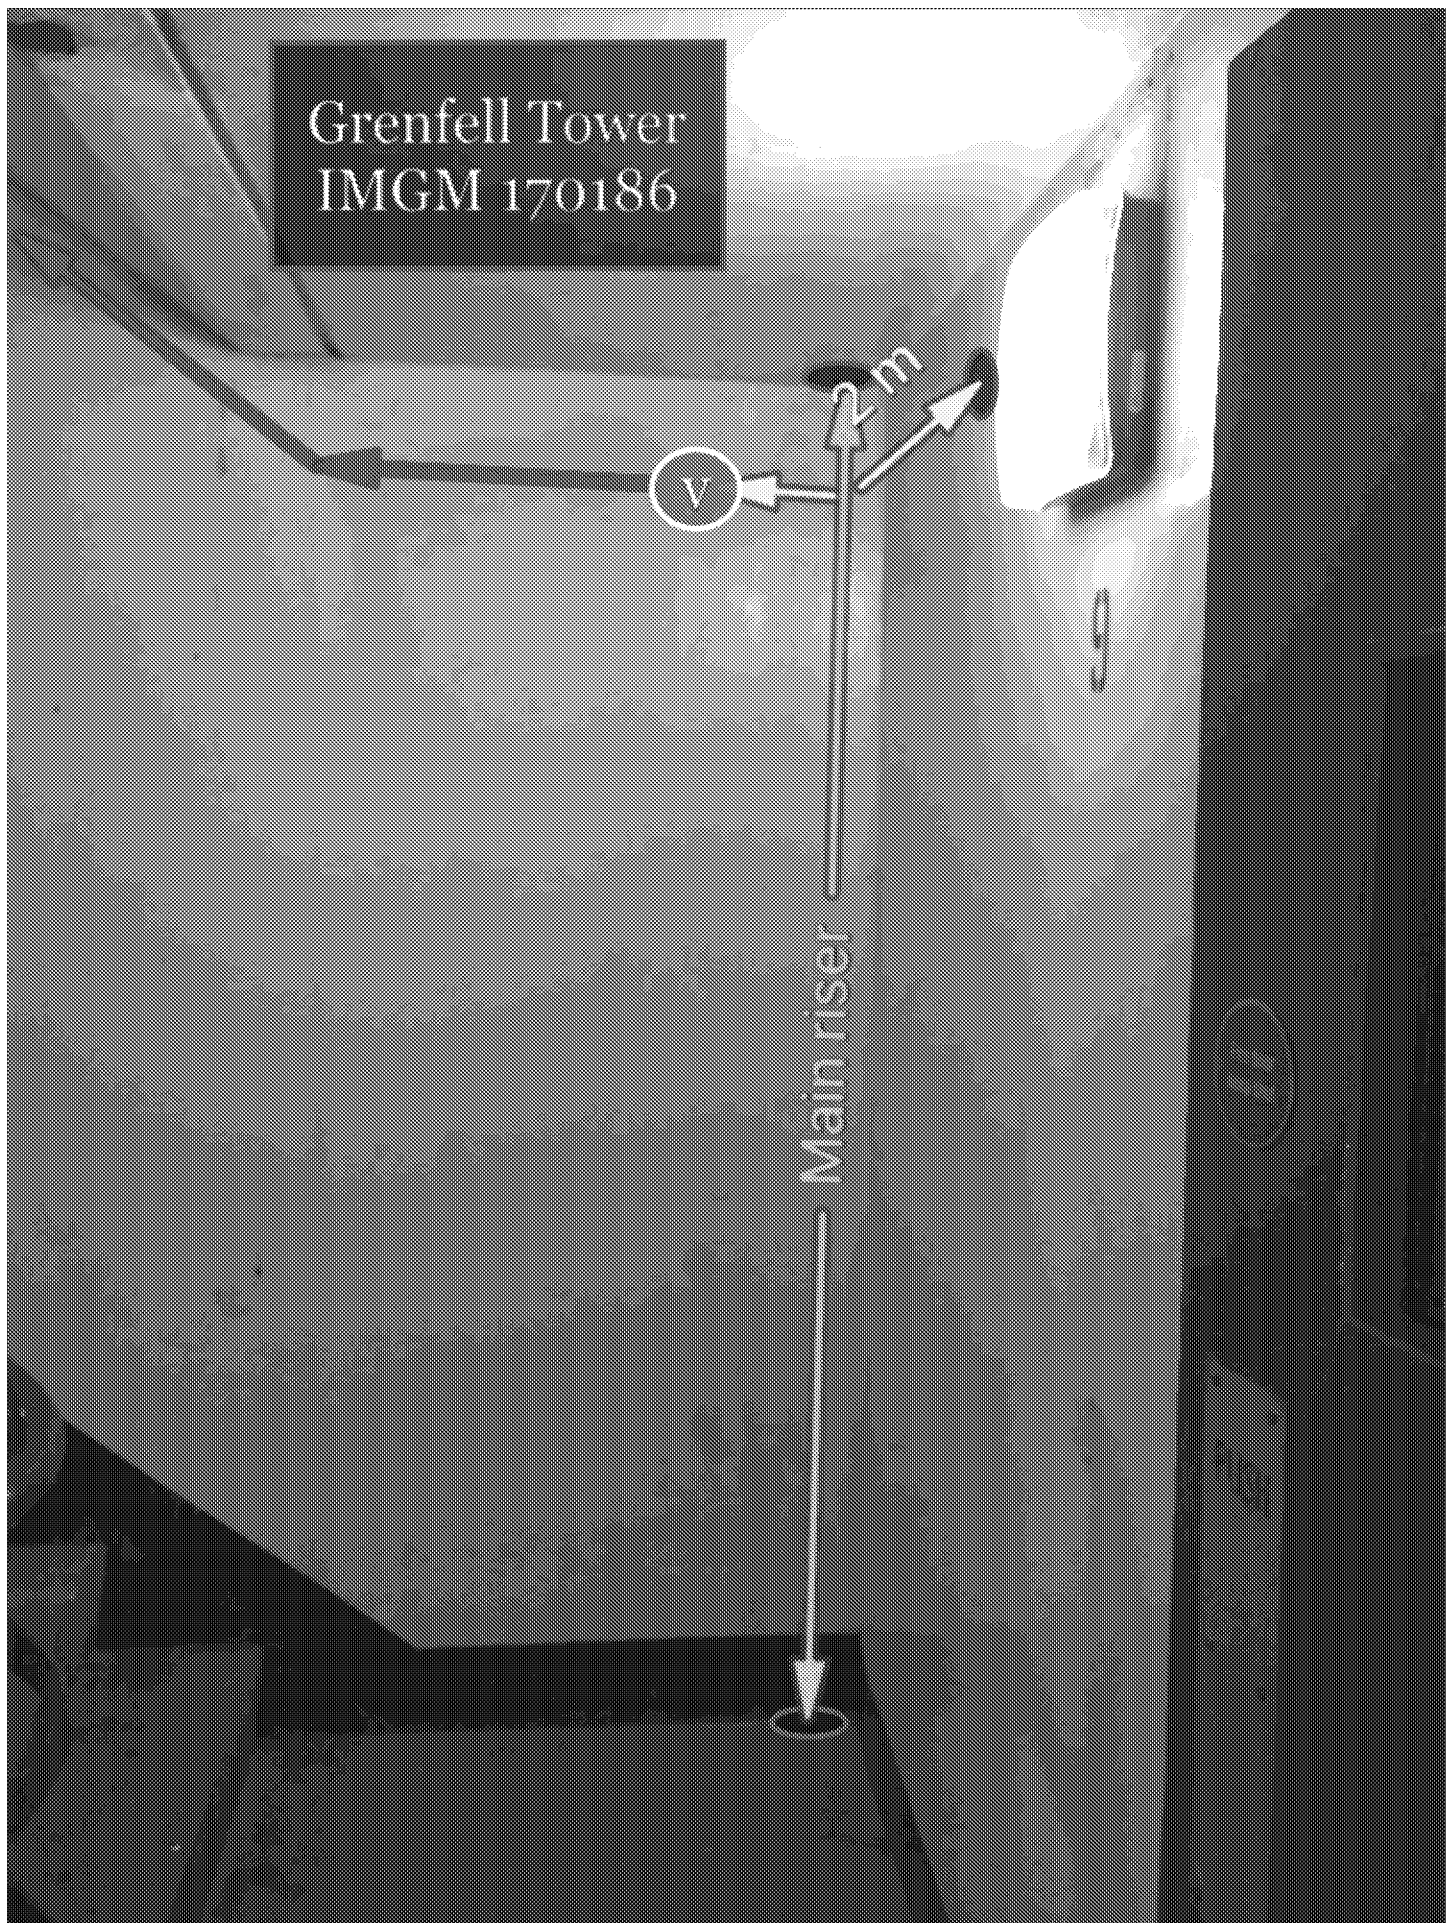

Outlet works would require a rerun back to the original meter positions which is closest to the resite. Allow 10m outlet per flat.

VENTILATION/G5

Once the pipe work is installed, the riser system could be segregated from the mechanical air extraction by being boxed in. There is a route out to fresh air through the basement & would assume a route out through the top floor (no access to roof as locked).
